Disclosure; Fig 10; 97pp; English.

This invention describes a method which uses the CCT (eukaryotic type II chaperonin) complex or part of it, for identifying a binding agent that can occupy a substrate-binding site (SBS) on the CCT complex. By binding to the CCT complex, the binding agents bloss so that biological activity of the CCT complex is affected, particularly its ability to fold substrates such as actin, tubulin and cyclin. The binding agents are useful for treatment of cancer, particularly when used in combination with an anticancer drug, or viral infections. Nucleic acid fragments are used to screen for agents, e.g. binding agents that modulate interaction between the CCT complex and a protein that is to be folded. The binding

wagnitis), inflammatory conditions (e.g., mastitis, cophoritis and vagnitis), immune disorders (e.g., congenital and acquired theories, autoimmune opphoritis, systemic lupus erythematosus), immune disorders (e.g., congenital and acquired theories, sutoimmune cophoritis, systemic lupus erythematosus), cespiratory disorders (e.g., anaemia), cardiovascular disorders, and uninary system disorders. Ovarian antigen polypeptides and polynucleotides may also be used in screening for compounds which modulate ovarian antigen or activity. The polynucleotides may further be used for gene therapy, chromosome mapping, in the collection of individuals and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophia. The invention is useful in developmental biology and in elucidating cell signalling and cell.cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABLIG176, ABLIG119, expressed DNA sequences (ABLIG186) and the encoded proteins (ABBS7737-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP4328) and to CDNAs encoding them (ABQ54131-ABQ56305), and also compasses polypeptides 90% identical and polymucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polymucleotides, antibodies against human ovarian antigens and the use of ovarian antigen polymucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cystes, and dysmenorrhoea), endocrine disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ovarian cancer; breast cancer; tumour; reproductive system disorder; infertility; pregnancy disorder; anovulation; polycystic ovary syndrome; PCOS; ovarian cyst; dysmenorrhoea; endocrine disorder; infection; inflammatory condition; immune disorder; blood disorder; cardiovascular disorder; respiratory disorder; neurological disorder; gene therapy; chromosome mapping; forensic analysis; antibody preparation; cytostatic; immunomodulatory; neuroprotective; antiinflammatory; gynaecological; reproductive.

shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and vaginitis), immune disorders (e.g., congenital and acquired immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), blood-related disorders (e.g., anaemia), cardiovascular disorders, respiratory disorders, neurological disorders, gastrointestinal disorders of and urinary system disorders. Ovarian antigen polypeptides and polymelocides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may care therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, ovarian antigen, ovary, ovarian, breast, cancer, tumour, ovarian cancer, breast cancer, tumour, reproductive system disorder; infertility, pregonancy disorder, anovulation, polycystic ovary syndrome, PCOS, ovarian cyst, dysmenorrhoes, endocrine disorder; infection; inflammatory condition; immune disorder; blood disorder;

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP4328) and to CDRAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polypucleorides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen and the use of ovarian antigen polypucleotides and and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast related clsorders. Such conditions include ovarian cancer and breast cancer, and disorders (e.g., infertility, disorders origin, reproductive system clsorders (e.g., infertility, disorders origin, reproductive system disorders (e.g., infertility, disorders origin, reproductive system closystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infertions (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, cophoritis and immunodeficiencies, autoimmune ophoritis, systemic alsorders, autoimmune ophoritis, systemic alsorders, crepirated disorders (e.g., anamia), cardiovascular disorders and urinary system disorders. Devaian antigen polypeptides and completed disorders (e.g., anamia), cardiovascular antibodies (e.g., anamia), and the polypeptides may be used in forensic analysis, and the sequence data for this patent did not form part of the printed sequ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ftp.wipo.int/pub/published_pct_sequences

Introducing foreign gene into insect cell, involves introducing DNA having foreign gene integrated between inverted repeat sequences of piggyBac transposon and piggyBac transposase that acts on inverted repeat sednence.

Disclosure; Page; 25pp; Japanese.

This invention relates to a novel method for introducing a foreign gene into an insect cell. Specifically, it refers to a foreign gene occurring between inverted repeat sequences of a piggyBac transposon and using a piggyBac transposon and using a piggyBac transposon and using a piggyBac transposonse for gene transfer to give a high recombinant efficiency. The present invention describes the insect cell as that of Lepidoptera insect origin, preferably it is the silk worm Bombyx mori, and stable integration occurs into the genome of this insect using the transposase enzyme. In particular, this gene transfer method uses the plasmid pigA3Cy3GFP which contains a Cycle3 GFP gene expressed under a silk worm actin promoter. As promoter, between a pair of inverted repeat equences of the transposon pigGyBac. This polypeptide sequence is the protein product from the pigA3Cy3GFP plasmid DNA that represents the silkworm actin promoter controlling expression of the Cycle3 GFP gene silkworm are membedded protein in the sequence is the given in an exemplification of the invention. NOTE: This sequence is cluther within the specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention provides a treatment for sickle cell anaemia, which comprises administering a reducing agent. The treatment inhibits the formation of irreversible sickled cells (ISC) and reverses ISC formation in the blood. The present sequence represents the human beta-actin protein. The sequence is used in the invention to demonstrate that a distulphide bridge is formed between cysterines 284 and 373 in ISC beta-actin as a post-translational modification. The reducing agent used in the treatment acts to correct this post-translational modification
                           polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primar for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.
                  The invention relates to a novel human polynucleotide and the encoded

The present invention relates to human cardiac actin (ACTC). Genotypic analyses show that ACTC is linked to idiopathic dilated cardiomyopathy (IDC). The ACTC gene maps to chromosome 15q14. Six PCR primer pairs (AAA49020 to AAA49031) have been developed to allow analysis of the six exons of ACTC. Studies of two families with IDC showed the presence of two mutations, one in exon 5 and one in exon 6. The present sequence is a mutant of posttranslationaly modified ACTC without the initial two residues. The mutation is a clu to Gly mutation at position 361. The ACTC protein may be used in a variety of methods for drug screening and for rational drug design. The ACTC gene may be used to treat IDC by gene therapy. Analysis of the ACTC gene may be used to treat IDC by gene therapy. Analysis of the ACTC gene provides early identification of subjects likely to develop or who already have IDC. Note: The present sequence is not shown in the specification but is derived from the ACTC sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is human cardiac actin (ACTC) protein, without the initial Met-Cys which is posttranslationally removed. Genotypic analyses show that ACTC is linked to idiopathic dilated cardiomyopathy (IDC). The ACTC gene maps to chromosome 15q14. Six PCR primer pairs (AAA49020 to AAA49031) have been developed to allow analysis of the six exons of ACTC. Studies of two families with IDC showed the presence of two mutations,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New cardiac actin gene comprising histidine to arginine or glycine glutamic acid substitution, useful in the diagnosis of diseases associated with the mutation, specifically idiopathic dilated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human cardiac actin protein after posttranslational modification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                              Expression vector contg. drug resistant marker gene - useful for transformation of thymidine kinase-deleted human cells for high levels of
                                                                                                                                                                                                                                                                                                                                                                          This sequence is encoded by a drug resistant structural gene which may be used in the expression vector of the invention. This gene is used as the selective marker in the vector. The resulting vector may be used to transform a thymidine-kinase deleted cell allowing introduction of a foreign structural gene. The transformed cell may be used to produce large amounts of useful protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New cardiac actin gene comprising histidine to arginine or glycine to glutamic acid substitution, useful in the diagnosis of diseases associated with the mutation, specifically idiopathic dilated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to human cardiac actin (ACTC). Genotypic analyses show that ACTC is linked to idiopathic dilated cardiomyopathy (IDC). The ACTC gene maps to chromosome 15q14. Six PCR primer pairs to AAA49020 to AAA49031) have been developed to allow analysis of the six exons of ACTC. Studies of two families with IDC showed the presence of two mutations, one in exon 5 and one in exon 6. The present sequence is a mutant of posttranslationaly modified ACTC without the initial two protein may be used in a variety of methods for drug screening and for rational drug design. The ACTC gene may be used to treat IDC by gene therapy. Analysis of the ACTC gene provides early identification of subjects likely to develop or who already have IDC. Note: The present sequence is not shown in the specification but is derived from the ACTC
one in exon 5 and one in exon 6. The mutations are G to A in codon 312 (Arg312His) and A to G in codon 361 (Glu361Gly). The ACTC protein may be used in a variety of methods for drug screening and for rational drug design. The ACTC gene may be used to treat IDC by gene therapy. Analysis of the ACTC gene provides early identification of subjects likely to develop or who already have IDC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      In vitro assays for skin stress and skin ageing includes determination of spondin 2, cathepsin L, actin gamma 1 and vimentin fragments secreted by skin fibroblasts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to in vitro methods for the detection of skin stress and/or skin ageing in humans and animals based on the determination of spondin 2, cathepsin L, actin gamma 1 or vimentin fragments secreted by fibroblast from the skin under test. Use of the methods in a test for potential cosmetics and pharmaceuticals with an effect on these skin conditions and products contexining vimentin fragments are also included. Products contexining vimentin fragments are effective in the regulation, especially maintenance, of skin homeostasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                       Gaps

The invention relates to the isolation of novel genes (ACF3446-ACF34559)

cencoding proteins (ABR64180-ABR64281) involved in the process of
angiogenesis. The nucleic acid molecules are useful in identifying and/or
obtaining full-length human genes involved in an angiogenic process. The
cobtaining full-length human animals derived from these are useful for
concleic acid molecule, polypeptides or complexes encoded, cells or
concleic acid molecule, polypeptides or complexes encoded, cells or
concleic acid molecule, polypeptides or complexes encoded, cells or
concleic acid molecule, planman animals derived from these are useful
concleic acid molecule, planman animals derived from treating
angiogenesis-related disorders. They are also useful for diagnosing,
involves uncontrolled or enhanced angiogenesis or is a disorder in which
a decreased vasculature is of benefit (e.g. cancer, rheumatoid arthritis,
concleic acid sections or involves inappropriately arrested or decreased
angiogenesis or is a disorder in which an expanding vasculature is of
congiseration or involves inappropriately arrested or decreased
angiogenesis or is a disorder in which an expanding vasculature is of
modulator of expression or activity of the polypeptide encoded by the
concleic acid sequence is useful for manufacturing a medicament for the
concert the provest of the polypeptide corresponds
                                                                                                            antirheumatic; antiarthritic; antidiabetic; ophthalmological;
                                                                                                                              antipsoriatic; antiarteriosclerotic; cardiant; vasotropic; angiogenesis; gene therapy; vasculature; cancer; rheumatoid arthritis; psoriasis; diabetic retinopathy; cardiovascular disease; atherosclerosis; ischemic limb disease; coronary artery disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          prognosticating or treating an angiogenesis-related disorder, e.g. cancer, rheumatoid arthritis, diabetic retinopathy, psoriasis or cardiovascular diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New angiogenic genes and polypeptides, useful for diagnosing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 15; SEQ ID NO 206; 90pp; English.

                                                                                                                                                                                   RESULT 13

US-09-940-016-11313

Sequence 11313, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

PILE REFERENCE: CL001307

CURRENT FILING DATE: 2000-04-14

PRIOR PLILNG DATE: 2000-10-20

PRIOR PLILNG DATE: 2000-10-20

-!- FUNCTION: Actins are highly conserved proteins that are involved
in various types of cell motility and are ubiquitously expressed
in all eukaryotic cells (By similarity).
-!- SIMILARITY: Belongs to the actin family.
-!- SIMILARITY: AAC38981.1;
-- HSSP; PO2577; INM1.

Buelow H.E., Bernhardt R.;
Submitted (OCT-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Actins are highly conserved proteins that are involved in various types of cell motility and are ubiquitously expressed in all eukaryotic cells (By similarity).
-!- SIMILARITY: Belongs to the actin family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                              Convergent phenotypes.;
Proc. Natl. Acad. Sci. U.S.A. 100:1808-1813(2003)
-!- FUNCTION: Actins are highly conserved proteins that are involved in various types of cell motility and are ubiquitously expressed in all eukaryotic cells (By similarity).
-!- SIMILARITY: Belongs to the actin family.
